

Small fires and fire patch information

Thanks to the higher resolution of MERIS sensor (300m), Fire_cci burned area could capture better the smaller fires, such as the agricultural burning shown in eastern and central Asia.

Added-value data set for fire community: fire (elliptical) patch information reconstructed from the pixel burned area data. Top figure shows the ratio of x/y of the fire ellipse; bottom figure shows Perimeter/Area (P/A) ratio.
